The Impact of School Principals on Teachers, Classrooms, and Families

October 2026

What is the impact of a change in school leadership?

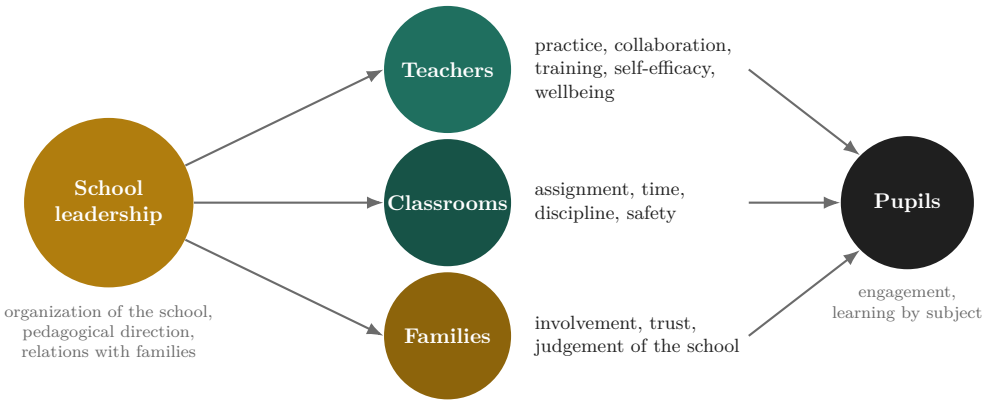

In a system where principals have limited authority and few teachers want the job.

Related literature

- One SD of principal quality moves achievement by 0.03 to 0.10 SD (Branch, Hanushek, and Rivkin, 2012; Bartanen, Husain, and Liebowitz, 2024).
- A change of principal lowers achievement by 0.03 SD and raises teacher exit (Bartanen, Grissom, and Rogers, 2019).
- The identified channel is personnel: who is hired, retained, and dismissed (Grissom and Bartanen, 2019; Muñoz and Prem, 2024).

What is not identified is the effect on the practice and effort of a fixed staff, on the organization of classrooms, and on parental inputs.

Causal map

School leadership
organization of the school, pedagogical direction, relations with families
Teachers
Classrooms
Families
practice, collaboration, training, self-efficacy, wellbeing
assignment, time, discipline, safety
involvement, trust, judgement of the school
Pupils
engagement, learning by subject

Institutional setting

- Spanish principals are teachers elected for four years. They do not hire, dismiss, set pay, or set the curriculum.
- A change of principal therefore changes leadership on a fixed staff.
- Terms end by rule: retirement at 65, and at most two renewals, twelve years.

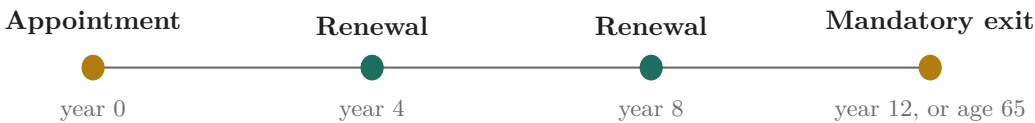

Data: LOMCE standardized tests in mathematics, Spanish, and English for the universe of Madrid public primary schools, 2015–2018, with supplementary questionnaires to parents, teachers, and principals.

The selection of principals, Madrid 2015–2018

	Share
Competitions with a single candidate	75%
Competitions with two or more candidates	25%
Deserted competitions, filled by the administration	4%
Contested competitions not won by the top-merit candidate	39%

Source: official records of about 1,000 competitions, with candidates, merit scores, winners, and committees (Montalbán, 2026).

Identification strategy

- Treatment: an exit forced by age or tenure. Control: schools whose principal has not reached either limit.
- Assumption: the exit date is unrelated to school shocks. Test: no pre-trends.
- Voluntary and deserted successions estimated separately, as the selection benchmark.

Empirical specification

$$Y_{ist} = \alpha_s + \lambda_t + \sum_{k \neq -1} \beta_k \, \mathbf{1}[\, t - \tau_s = k \,] + \varepsilon_{ist}$$

- τ_s: first school year under the new principal. i: a teacher, classroom, pupil, or parent.
- The school is the unit of treatment; outcomes are repeated cross-sections within it.
- Staggered-robust estimator, not-yet-treated controls, clustered by school. 2SLS on the realized change where the tenure rule does not bind.

Dispersion and heterogeneity of principal effects

Dispersion of principal effects, from excess variance around rule-based exits (Jones and Olken, 2005):

$$\text{Var}(\Delta Y_{st} \mid \text{exit}) - \text{Var}(\Delta Y_{st} \mid \text{no exit}) = 2\sigma_\theta^2$$

Heterogeneity by characteristics determined before the change:

$$Y_{ist} = \alpha_s + \lambda_t + \beta D_{st} + \delta\, D_{st} \times W_s + \varepsilon_{ist}$$

W_s includes how the vacancy was filled, the successor's merits and age relative to the incumbent, the successor's practices as a teacher in the previous year, and the staff's rating of the incumbent.

Challenges

- Power: 100 to 200 mandatory exits in primary over three transitions; effects of 0.03–0.05 SD on scores, larger on survey indices.
- Panels: the share of tutors and pupils re-observed is unknown.
- The tenure rule needs appointment histories since 2004; the age rule needs the count of principals above 65.

Next steps

- Count exits by age and by tenure among primary schools, by year.
- Share of tutors re-observed across years.
- Re-run the deserted-competition regression with mandatory exits as treatment and the incumbent's prior satisfaction as outcome: a flat pre-period is the pre-trend test.
